

Tables

Heterogeneity in direct replications in psychology and its association with effect size

Table 1

Effect size ρ_{xy} and its heterogeneity as a function of true effect size and measurement reliability.

	$\rho_{xy} = 0$	$\rho_{xy} = .3$	$\rho_{xy} = .5$
$\sqrt{R_{xx'}} \times \sqrt{R_{yy'}} = .6$	0	0.18	0.30
$\sqrt{R_{xx'}} \times \sqrt{R_{yy'}} = .7$	0	0.21	0.35
$\sqrt{R_{xx'}} \times \sqrt{R_{yy'}} = .8$	0	0.24	0.40

Note:

Values in cells are observed effect sizes arising from the true effect size ρ_{xy} and measurement reliabilites $\sqrt{R_{xx'}} \times \sqrt{R_{yy'}}$. Code to reproduce table: osf.io/kf6pt/

Table 2

Pre-registered multi-lab replication projects

RP	Paper	k	Countries	Effects	Participants	Description of Effects
ML1	Klein et al. (2014)	36	10	16	5975	Two correlational effects: 'Gender math attitude' compared implicit attitudes (IAT) towards math between genders and 'IAT correlation math' correlated implicit attitudes with self-reported measures. The remainder were experiments with two independent groups. The groups were primed in some way (Anchoring 1-4; low vs. high category scales; norm of reciprocity; flag priming; currency priming), asked to imagine slightly different situations (Sunk costs; gain vs. loss framing; gambler's fallacy; imagined contact) or asked their agreement with statements presented differently (Allowed vs. forbidden; quote attribution).
ML3	Ebersole et al. (2016)	21	2	10	2845	Several effects were experiments with two independent groups. The groups were either primed in some way (Power and perspective; warmth perceptions; subjective distance interaction), saw slightly different statements (Elaboration likelihood interaction; credentials interaction) or experienced different situations (weight embodiment). Examined interactions were between treatment conditions and participant characteristics. One priming effect (metaphor) compared two treatment groups with a control. One effect was correlational: 'persistence and conscientiousness' was measured by an unsolvable anagram task and self-report respectively. The Stroop task is a within-person experiment with two conditions and the 'Availability' effect asks participants to judge whether some letters are more common in the first or third position.
RRR1	Alogna et al. (2014)	32	10	1	4117	Verbal overshadowing 1; Independent groups experiment. Participants either described a robber after watching a video or listed countries/capitals. DV = correctly identifying the robber in a lineup.
RRR2	Alogna et al. (2014)	23	8	1	2442	Verbal overshadowing 2; Different from 1 only in that the filler task took place before the descriptive task instead of after.
RRR3	Eerland et al. (2016)	12	2	3	1187	Grammar on intentionality/intention attribution/detailed processing; Independent groups experiment with three outcome variables. Actions either described in imperfect or perfect.
RRR4	Hagger et al. (2016)	23	10	1	2872	Ego depletion; Independent groups experiment. Participants either assigned to a cognitively demanding task or a neutral and performance was then measured in a subsequent task.
RRR5	Cheung et al. (2016)	16	5	2	2071	Commitment on neglect/exit; Independent groups experiment with two outcome variables. Participants either primed to think about commitment or independence from partner.
RRR6	Wagenmakers et al. (2016)	17	8	1	1894	Facial feedback hypothesis; Independent groups experiment. Participants either induced to 'smile' or 'pouth' with a pen and then rated funniness of cartoons.
RRR7	Bouwmeester et al. (2017)	21	12	1	3596	Intuitive cooperation; Independent groups experiment. Economic game with money contribution to a common pool either under time pressure or time delay.
RRR8	O'Donnell et al. (2017)	23	13	1	4493	Professor priming; Participants were assigned to groups and primed with either a 'professor' or 'hooligan' stimuli. DV = Percentage correct trivia answers.

Note:

For studies with several effects the number of participants is the average across effects, rounded to the closest whole number. Participant numbers are those used for primary analyses by original authors (i.e., after exclusions). RP = Replication Project, k = no. primary studies, ML = Many Labs, RRR = Registered Replication Report. Code to reproduce table: osf.io/kf6pt/

Table 3

Heterogeneity across primary effects and statistical power of ten multi-lab replication projects, ordered with respect to estimated between studies variance (τ^2).

RP	Effect	k	Effect type	Effect size estimate	I^2 (%)	I^2 95% CI	τ^2	τ^2 95% CI	Type I Error Rate & Statistical Power			
									Level of heterogeneity			
									Zero	Small	Medium	Large
RRR7	Intuitive-cooperation	21	MD	-0.39	2.80	[0.00, 39.28]	0.83	[0.00, 18.67]	0.05	0.32	0.83	1.00

Note:

Effects were estimated in metafor using REML. The following effects are odds ratios transformed into standardized mean differences: 'Allowed vs. forbidden', 'Gain vs. loss framing', 'Norm of reciprocity', 'Low vs. high category scales'. RP = Replication Project, k = no. primary studies, CI = confidence intervals. Statistical power and type I error rates were simulated, where Zero = simulated type 1 error, and the other headers represent simulated power under small/medium/large heterogeneity ($I^2 = 25/50/75\%$) respectively. SMD = Standardized Mean difference (Hedge's g), MD = Mean Difference, RD = Risk Difference, r = correlation. Code to reproduce table: osf.io/kf6pt/

^a These effects were simulated as standardized mean differences
